Logging history, file management, 24/7/365 monitoring			✳
Internal rich chat, voice			✳
PBX on demand			✳

~we tailor services as required.

FAQ

Q: Are your cloud products secure?

A: Yes, we adhere to the same security and audit standards observed in the financial industry.

Q: Are you a public cloud service provider?

A: No. We build a cloud around every customer, a virtual private cloud. In some instances, we even offer a physical underlying infrastructure for a private cloud.

Q: Do we have to get a full solution at once?

A: It depends entirely on your requirements and / or preferences. In many cases, it is advisable to switch to a complete cloud service at once, but we view each project uniquely. For example, a customer might only need virtual servers, or a backup service, or an email service. We are happy to offer advice on the best way forward and deliver specific customer requirements.

Q: What sort of latency do we experience when connected to our virtual private cloud?

A: Less than 30 milliseconds.

Q: Are there migration costs associated with implementing vpcAsia service?

A: Yes. Roughly 15% of the first year's subscription value.

About us

vpcAsia was founded in Tokyo, Japan, in 2016, with the mission of enabling personalized and protected access to virtual private computer environments and secure data storage, ANYTIME, ANYWHERE, from ANYTHING. We are a global team composed of members with profound expertise and experience in each role, with high exposure to IT and user insights & usability in such different sectors as military, security, banking, management consulting, medical, social media and retail and with high sensitivity to cutting age technology.

Customers are predominantly from the financial sector and other sectors that require highly reliable data access in a secure environment without compromising built-in business continuity and regulatory compliance. vpcAsia seeks to partner with customers who wish to outsource IT operations into a private cloud space to ensure better returns on IT investment and to focus on core business and innovation without security compromises evident in public clouds.
